```
The invention relates to methods for predicting toxic effects of compounds or the progression of these toxic effects by determining the compounds or the progression in tissues or cells exposed to the toxin and comparing these to gene expression in unexposed tissues or cells. Also included are methods of predicting at least one toxic ceffect of a compound or progression of a toxic effect, preferably the expression in a tissue or cell sample exposed to the compound of two or cell sample exposed to the compound of two or ceression in a tissue or cell sample exposed to the compound of two or more genes is indicative of at least one toxic effect or progression of the method can also be used to identify an agent which modulates the method can also be used to identify an agent which modulates the coxic response and predict cellular pathways that a compound modulates in a cell. The methods utilise a set of at least two probes (on a solid specifically hybridises to a gene listed in the specification, a computer system comprising at least two genes listed in the specification, computed and atabase containing information identifying the expression level in a tissue or cell sample exposed to present information identifying the expression level in a tissue or cell sample expression economic confidenting global confidence in the specification. The method is useful for elucidating global confidence in the specification. The method is useful for elucidating global confidence in the markers in the proposed to a known toxii. The genes may be used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         issues or cell exposed to a known toxin. The genes may be used as coxicity markers in drug screening and toxicity assays. The genes and gene expression information may be used as diagnostic markers for the prediction or identification of the physiological state of tissue or cell
                                                                                                                                                                                                                                                                                                                                                Predicting toxic effects of compounds or the progression of these tox effects by determining the changes in gene expression in tissues or cells exposed to the toxin and comparing these to gene expression in unexposed tissues or cells -
                                                                                                                                                                                                                                                                   Johnson KR, Castle AL, Elashoff MR;

The present invention describes a method (M1) of determining an individual's predisposition to epilepsy and/or development of epilepsy, as well as predicting the individual's response to medication. The method comprises determining the genotype of at least one gene selected from SCN1A, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation sodium channel genes located on chromosome 2. The idiopathic generalised 2923-931. Compounds identified as modulators of the biological activity of SCN1A, SCN2A or SCN3A proteins or genes, are useful for treating epilepsy or other neurological disorders. They have anticonvulsant and epilepsy or other neurological disorders. They have anticonvulsant and neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to AAB99679 represent SCN1A, SCN2A, and SCN3A cDNAS, gene fragments, PCR primers, oligonucleotides and proteins given in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method (MI) of determining an individual's predisposition to epilepsy and/or development of epilepsy, as well as predicting the individual's response to medication. The method comprises determining the genotype of at least one gene selected from SCNIA, SCN2A or SCN3A, or a DNA variant, equivalent, or mutation which shows a linkage disequilibrium. SCNIA, SCN2A and SCN3A-are all sodium channel genes located on chromosome 2. The idiopathic generalised
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           epilepsy (IGE) gene is more specifically localised on chromosome 2q23-q31. Compounds identified as modulators of the biological activity of SCNIA, SCNZA or SCN3A proteins or genes, are useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                 epilepsy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   epilepsy or other neurological disorders. They have anticonvulsant and neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to AAB99679 represent SCNIA, SCN2A, and SCN3A cDNAS, gene fragments, PCR primers, oligonucleotides and proteins given in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           enhancer
                                                                   FT
                                                                                                                                                         The invention relates to an isolated and/or purified nucleic acid encoding a human soluble secreted endopeptidase (SEP). The anti-SEP antibody and the compound which inhibits or selectively inhibits the human SEP protein are useful in the manufacture of a medicament for the prophylaxis and/or treatment of sexual dysfunction, in particular male erectile dysfunction (MED) or female sexual dysfunction (FSD) also useful for treating the above disorders and other disorders such also useful for treating the above disorders and other disorders such hypoactive sexual desire disorder. The present sequence is SEP consensus DNA sequence found in human, mouse and rat.
                                                                An isolated and/or purified nucleic acid encoding a human soluble secreted endopeptidase which is useful for treating sexual dysfunction, for e.g. male erectile dysfunction or female sexual dysfunction such as

                                                                                                                                                                                                                                                                                                                                                        initiation site. This sequence contains regulatory elements specific to smooth, cardiac and skeletal muscle cells, and includes CArC-like sequences. CArG motifs are elements known to regulate many musclesspecially the alpha actin gene in cardiac and specific genes, especially the alpha actin gene in cardiac and cardiac and cardiac and skeletal muscle. Sequence comparison between the murine and human desmin gene 5' flanking sequences (AAA38443, AAA38444) shows four conserved regions between the two species, one of which is located in the arterial smooth muscle-specific region. Murine desmin 5' flanking region sequences may be used to construct expression cassettes for tissue-specific expression of a gene of interest. The sequence of at least part of 10000 to 4600 (preferably 4006 to 4603) of the mouse cander the expression of a gene of the human desmin gene) is used to target the expression of a gene to cardiac, skeletal, or smooth muscle, and at least part of 5000 gene for the cardiac, skeletal, or smooth muscle, and at least part of 5000 for 6000 (preferably 4006 to 2495)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and at least part or -boud to -2400 (preserved)

(AAA38442) of the mouse desmin gene is used to target the expression of a gene to a minimal promoter in an arterial smooth muscle. The expression cassettes, and vectors and eukaryotic cells comprising the expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ischaemia, intimal hyperplasia, hypercholestesterolaemia, atherosclerosis and smooth muscle proliferation.
                                                                                                                                                                                                                                                                                                             sequence represents the murine desmin gene promoter, comprising the between nucleotides -3168 to +83 relative to the transcription
                                                                                                                                                                              Novel nucleic acids comprising the 5' flanking region of a desmin gene located useful producing drugs and targeting gene expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Desmin gene; 5' flanking region; promoter; cardiovascular disease; smooth muscle cells; restenosis; ischemia; intimal hyperplasia; atherosclerosis; hypercholesterolemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  transgenic animal; gene expression; artery;

The desmin gene encodes a cytoskeletal protein constitutive of intermediate filaments which occur in the cytoplasm of most muscular cells. Studies have revealed a complex regulatory mechanism to promote the temporal and tissue-specific expression of the desmin control sequences have been described in the first 1000 bp of the 5' flanking region of the cessin gene. It is thought therefore that the desmin gene promoter cells and this might be beneficial to avoid the potential side effects inherent to a widespread gene expression. The desmin gene 5' flanking region can be used to prepare expression. The desmin gene 5' containing a selected gene for the controllable expression of that gene: Such methods could be used for gene therapy, of cardiovascular atheroscherosis, hypercholesterolemia and smooth muscle cell proliferation), for expression of a therapeutic polypeptide, antisense molecule or ribozyme, e.g. in cases of genetic disorders, antisense molecule or ribozyme, e.g. in cases of genetic disorders, used to produce transgenic animals, useful as models for studying effects of the desmin gene 5' flanking region and heterologous genes the desmin gene 5' flanking region and heterologous expression of effects of the desmin gene 5' flanking region and heterologous genes the desmin gene 5' flanking region and heterologous genes cope expression such avergence of the using attached genes to cardiac, skeletal and smooth muscle cells, cespecially arterial smooth muscle cells, cespecially arterial smooth muscle cells and pulmonary artery.
                                                                                                                                                                                                                                                                                    in gene therapy,
                                                                                                                                                                                                                                                                    New regulatory region from the desmin gene, useful in gene operticularly of cardiovascular disease, provides expression specifically in arterial smooth muscle cells
                                                                                                                                                                                                                                                                                                                                                           Claim 1; Figure 1; 37pp; English

Complete genome sequence of Chlamydia trachomatis. (first entry) 07-0CT-1999

Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; bartholinitis; pneumopathy; vehereal lymphogranulomatosis; ss.

Chlamydia trachomatis

WO9928475-A2

```
trachonatis. Open reading frames (ORFS) of the genome encode polypeptides AAX36754-Y37949. The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microoraganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion epidymitis, genital diseases such as nongonococcal uretritis, penumpathy in breast feeding infants; and venereal premumpathy in breast feeding infants; and venereal lymphogramical control of the invention may be of use in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .0-S066
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0-S066
                                                                                                          4-MAY-1
                                                                                                                                            9-MAY-1
                                                                                                                                                                                                                                 - MAY -
                                                                                                                                                                                                4 - MAY -
                                                                                  The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oilgo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
     obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                            ö

BQ303884	
LOCUS	BQ303884 273 bp mRNA linear EST 16-MAY-2002
DEFINITION	PM1-BT0759-200700-006-b07 BT0759 Homo sapiens cDNA, mRNA sequence.
ACCESSION	BQ303884
VERSION	BQ303884.1 GI:20821027
KEYWORDS	EST
SOURCE	human.
ORGANISM	Homo sapiens
	Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
	Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.
REFERENCE	1 (bases 1 to 273)

was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil4732114 [gb]h2129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and

/note="Vector: Landar 2AP II (Stratagene); individual /note="Vector: Landar 2AP II (Stratagene); individual clones excised into phagemid pbluescript; Site_1: EcoR I; Site_2: EcoR I; Genomic DNA was prepared from asynchronous blood stage forms of the Belem line of P. vivax grown in squirrel monkeys. Parasitized erythrocytes were purified from contaminating host leukocytes by filtration of ADP activated blood through acid-washed glass beads and Whatman CFII cellulose columns by gravity filtration. Purified DNA was digested with mung bean nuclease in the presence of 4.5.% formamide at 50cc as described (Galinski, M. et al. 1992. Cell 69.1213-1226; Vernick, K.D. et al. 1988. N.A.R. 16, 6883-6896). Eco RI linkers were added and the constructs ligated into Lambad ZAP II. P. vivax Belem was originally isolated from a patient in Belem, Brazil 1980 by Mercia de Arruda, adapted to Salmiri monkeys, by Jurg Gysin, and maintained since 1983 in

/note=Torgan: head_neck; Vector: puc18; Site_1: Smal; Site_2: Smal; A mini-library was made by cloning products derived from ORESTES PCR (U.S. Letters Patent application No. 196,716 - Ludwig Institute.for Cancer Research) profiles into the pUC 18 vector. Reverse transcription of tissue mRNA and cDNA amplification were performed under low stringency conditions.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

NOTE: This is a "working draft' sequence. It currently consists of 56 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      On May 3, 2001 this sequence version replaced gi:13277223.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

                                                                                                                                         NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 3 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as arbitrary. Gaps between the contigs are represented as Thus of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

IMPORTANT: This sequence is not the entire insert of clone
RP5-98D7 It may be shorter because we sequence overlapping
sections only once, except for a 100 base overlap.
The true left end of clone RP5-989D7 is at 1 in this sequence. The
true left end of clone RP5-989D4 is at 19691 in this sequence. The
true right end of clone RP11-199014 is at 19977 in this sequence.
